

ABSTRACT OF THE DISCLOSURE

A method of defining a link between first and second applications windows on a processing system. The processing system has a database and at least one remote end station coupled to the database via a communications system. The method comprises operating the end station so as to:

- a. access a first applications window;
- 10      b. cause the processing system to enter a link defining mode and access a second applications window, thereby causing the processing system to define a link between the first and second applications windows; and,
- 15      c. generate link data defining the link, the link data being stored on the database.
